

Special Instructions for Bonafide XTR130 Install

Because of the unique shape of the Bonafide XTR130 tail section, the Freedom Launcher 2 degree leg sweep needs to be modified. What essentially needs to be done is to install the crossbar oriented 180 degrees from normal. That means the front of the crossbar (widest part) needs to be towards the back, forcing the leg sweep to open up and taper out rather than taper in. This will allow a 46" crossbar to fit snugly in the normal landing gear position.

Due to this factor, the legs need to be swapped as well.

Therefore, the leg labelled **2L** will go on the **right side** and the leg labelled **2R** will go on the **left side**. Making this swap will ensure that the axles will swing down properly and be aligned perpendicular to the long axis of the kayak when wheels are deployed.

-2 leg sweep shown below.
